

ABSTRACT OF DISCLOSURE

AI
A liquid crystal display device and a manufacturing method therefor are provided, both aimed to eliminate the display's irregularity in the vicinity of the liquid crystal injecting port of a liquid crystal panel and provide a good display in the entire display area. In the liquid crystal panel, a lower substrate with thin film transistors for switching for pixel selection on its inside surface and an upper substrate having color filters for multiple colors on its inside surface are disposed in opposition with each other with a layer of liquid crystal compound being interposed therebetween. The lower substrate and the upper substrate are stuck to each other by sealing material which is arranged to surround a display area of the upper substrate and has, in a portion, a cut which serves as a liquid crystal injection port.
